Abstract of JP9262480

PROBLEM TO BE SOLVED: To efficiently produce 1-hexene useful as stock comoononer of linear low density PE from ethylene with high selectivity by using a catalyst for low polymn. of olefin produced from a chromium compd., aluminoxane and an imido compd.

SOLUTION: This catalyst used in production of 1-hexene by low polymn. of olefin is produced from a chromium compd. represented by the formula CrAm Bn (where A is alyl, arkyl, alkoxy, carboxylate, etc., and B is an N-, P- or As- contg. compd., etc.), aliminoxane and an imido compd. represented by the formula [where (d) is an integer of 1-4, M is H or a metallic element and each of R<1> and R<2> is one or more selected from among H, 1-10C alkyl, halogen, aryl, etc.].
